Domain Model

The Entities

The idea was that even though an extensive number of classes would emerge while developing the project, for the domain model, we only stuck with those that made sense functionally, as something visible to the player. There is a Board, which consists of Tiles; each Tile might or might not have an occupant (that being a Builder); each Player controls exactly two Builders and one GodCard. Some GodCards might not be selected by the Players for the game. There can be two to four Players playing the game simultaneously. GameMode, even though admittedly being a wild card, contains the rules for the game and connects Players to Board.

Assumptions:

- Several players can select a matching GodCard for the game.
- There are always two builders per player. This number cannot be reduced or increased.
- The board can be of any shape as long as it has at least one tile on it.
- Only one builder unit can occupy a tile at a time.
- All the GameModes are limited to being one round long, thus, only one board can be used at a time.
