User Stories - Santorini

3C Studio (Team 24)

… - Extension/Later Sprint User Story

- “I” ndependent (of all others)
- “N” egotiable (not a specific contract for features)
- “V” aluable (or vertical)
- “E” stimable (to a good approximation)
- “S” mall (so as to fit within an iteration)
- “T” estable (in principle, even if there isn’t a test for it yet)

1. As a player,
   I want to see the level of the top most building
   So that I can make decisions for my next moves.

   INVEST Explanation:

   1.1. This user story is independent of the others as it references the level of a building as its main issue, while being negotiable in how such a feature may be interpreted. There is clear value to being able to see how high each building is and the story has obvious bounds within the santorini rule set. It is easily testable and achievable within the 2nd iteration.

2. As a beginner player,
   I want to play a simple tutorial game mode
   So that I can learn how to play the game.

   INVEST Explanation:

   2.1. A tutorial is a unique independent concept within the user stories and is negotiable with plenty of potential implementations that is clearly bound within the concept of a ‘game mode’. It is valuable as it helps the player learn the game and could be implemented and tested as an extension.

3. As a player playing with Artemis,
   I want my workers to be able to move an additional time in accordance with my ability,
   So that I can get around the board quicker.

   INVEST Explanation:

   3.1. This user story applies the independent concept of the artemis god card and remains negotiable in how it may be implemented. It shows

value in providing complexity to the game, within reasonable bounds. It can be developed and tested during the 2nd iteration.

4. As a player,
I want to automatically lose the game when I can no longer move/build,
So that I am not confused by what to do and can start a new game.

INVEST Explanation:

4.1. This feature is valuable as it helps the flow of the game and lets the player know what happens when no options are available. The story is independent as it discusses a unique win/lose situation and is also small being a quick check in one iteration.

5. As a busy player,
I want to be able to save my game in the options, exit and press continue later
So that I can finish it when I am not busy.
INVEST Explanation:

5.1. The ability to save your game and continue it later is discussed independently in this user story. It is clearly valuable as the save function is indispensable to any busy gamer, allowing them to continue later.

6. As a player playing with Demeter,
I want to be able to build an extra time during my turn in different spaces,
So that I can gain an advantage in getting to the 3rd level.
INVEST Explanation:

6.1. This user story is independent via discussing the Demeter god card ability. It is negotiable as it allows for interpretation of how this ability will be used by the player while showing clearly the result. It can be finished within one iteration and play tested.

7. As a player trying the pompeii game mode,
I want my workers to be flung across the map when the building they are standing on is destroyed,
So that I can begin to rebuild my towers.

INVEST Explanation:

7.1. In this user story the possibility of a pompeii game mode is presented, where the player's builder is moved across the board in some method when the building they are standing on is destroyed. This story is negotiable as there are many details which may change in a new game mode. It is also valuable as it provides higher challenge levels to the player and estimable as this is one part of the pompeii game mode and provides a clear image of how it may work.

8. As a player trying the pompeii game mode,
I want a random building to be destroyed every 3-5 turns,

So that I can overcome the challenge and win the game mode.

INVEST Explanation:

8.1. This user story discusses the destruction component of the pompeii game mode and leaves interpretation for its frequency and appearance.This story is estimable as it is the other part needed to play this game mode and gives an idea of the challenges involved. It is small enough to implement and try out within one iteration/extension and negotiable in its implementation of how the building will be destroyed.

9. As a player,
I want to place my two workers on the game board,
So that I can begin the game.

INVEST Explanation:

9.1. This is a core function of the game needed for a player to begin playing the game and as such is independent of other stories. It is open to negotiation for exactly how it will happen, but is a straightforward action that is small enough to implement in the 2nd sprint/iteration.

10. As a player,
I want to move my workers into adjacent available spaces on the game board,
So that I can take my turn.

INVEST Explanation:

10.1. This user story is independent as it refers to the core mechanic of moving a player's workers. It is negotiable for additional features like highlighting while being small enough to reliably be built early into the iteration.

11. As a new player,
I want to start on the opening/start screen with 3-4 options to choose from,
So that I'm not overwhelmed by being thrown straight into a game.

INVEST Explanation:

11.1. This user story is independent as it is the only user story to relate to the opening screen, and it is negotiable in how the start screen will look and operate. It is valuable to players who want to have options to start but it has a clear amount of options available making it estimable.

12. As an opponent player,
I want a visual indicator which shows that a player's turn has ended and begun,
So that I can tell who is taking their turn.

INVEST Explanation:

12.1. This story is separate from other user stories as it describes a specific estimable visual indicator that denotes when the turn has ended and the next turn has begun. This keeps the user story small, while also leaving the polish of the icon up to negotiation.

13. As a player,
I want to be able to build in the available spaces around me,
So that I can get closer to winning the game.

INVEST Explanation:

13.1. A core function of the game, this user story ascribes to the independent, negotiable, valuable, estimable, small and testable values by leaving enough room for interpretation into how a core function of the game will be implemented.

14. As a competitive player,
I want to be prompted to choose my god card before the game begins,
So that I can pick the right one for me to play with.

INVEST Explanation:

14.1. This user story brings the unique value to the competitor by allowing them to choose the right god card and only refers to the choice of the god card therefore it can be implemented independently.The function for this user story is small enough therefore the task can be estimated to complete and it is negotiable for different ways to design it.

15. As a repeat player,
I want to bring up a settings/options screen during the game,
So that I can choose one of the options available at any moment.

INVEST Explanation:

15.1. This user story focuses on the particular aspect of the game which is independent and it is valuable for the player to customise their game experience. Also it is small to fit in a sprint and able to estimate and test because of its clear implementation. It can be tested by checking whether the options appear or not before the game.

16. As a competitive player,
I want to be able to restart the game quickly from any point via the options menu,
So that I can try different scenarios.

INVEST Explanation:

16.1. This user story is independent solely on the specific feature and negotiable for how the restarting game will behave. And it is valuable as it allows the player to try various scenarios. The task is small and

estimated due to its specific function and it can be tested by making sure that the game can be restarted anytime by the player.

17. As a player,
I want to be able to input my name before we begin,
so that I can keep track of who is who.

INVEST Explanation:

17.1. This user story is independent of the others as it describes a pre-game option. It is valuable to the player because without using the player's name it can be difficult to keep track of who is player 1/2.

18. As a player playing with Apollo,
I want my builder to be able to move into another workers space and swap our workers,
so that I can build in that area.

INVEST Explanation:

18.1. This feature provides value to the player by using the ability of Apollo and swapping to build the level and it depends only on Apollo's specific features. It is also negotiable for swapping implementations and it can be tested by checking if the swapping can be worked during the game. This user story is small and estimation can be made due to its specific functionality.

19. As a player,
I want the opponent builder to be unable to move to the tiles that are currently occupied by the workers of my own unless allowed by one of the god's powers,
so that the game would feel more fair to play.

INVEST Explanation:

19.1. This user story does not depend on other user stories and it enhances the player to have a fairness value. The scope for this is small, estimable for the implementation and negotiable to align with the game rules. It can be tested by ensuring the opponent workers are unable to move onto the occupied tiles if they are in lack of god powers.

20. As a player,
I want to have two workers (male and female),
so that I can diversify my strategy and make use of all the available game mechanics.

INVEST Explanation:

20.1. This user story opens negotiations for the specific abilities of gendered workers and is independent which just focuses on the two workers. It is enjoyable to the player for the game experience and ability to extend the standard features. The focus for the game is small and estimable for its concise scope and it is testable by ensuring the two workers can execute well in game strategy and mechanics.

21. As a player,
I want to end the game when I stand on the third layer of a building with my worker,
so that I can be announced the winner.

INVEST Explanation:

21.1. This user story satisfies the player to experience the victory and depends only on the winner condition. It is negotiable for how the game rules work such as whether specific conditions apply or not. It has a small scope to work in one sprint as it is just for winning announcements and can be tested by checking if the winning condition behaves as expected.

22. As a player,
I want it to be a game rule that neither of the players can build directly beneath their workers,
so that my opponent won't be able to secure a win by remaining in a single spot throughout the entire game.

INVEST Explanation:

22.1. This user story encourages the player to have balanced game strategies for winning interaction and leaves negotiation for the game design and rules. The function focuses on the placement which is small and independent from other rules and functions. Thus it is possible to make estimation and can be tested by confirming the player cannot build the tiles underneath of them.

23. As a player,
I want my workers to be able to go down from any number of levels without restrictions,
so that I will not lead my own workers to a dead end.

INVEST Explanation:

23.1. This user story prevents the player’s workers from being trapped easily and encourages more entertaining which is valuable and it depends solely on the workers movements. Negotiations are possible based on implementation of the specific game rules and it is small to work in one sprint which is estimable. It can be tested easily by

checking if the workers can jump down from any level during the game.

24. As a player,
I want to be able to look up the abilities of any god at any point in the game, so that I am aware of all the abilities and the win conditions my opponent would be trying to execute.

INVEST Explanation:

24.1. This user story gives unique value to the player to look at the abilities of the god cards in the game which can prevent the opponent from winning and be aware of the movements. It depends only on showing god card abilities and the negotiable for the design of how the god cards will appear. It is straightforward to implement it therefore it is small and estimable. It can be tested by verifying the feature is accessible during the execution.
